Hi, I've used your emulators in the past, and am looking for an updated version because the controller support on the last version I had downloaded was garbage. I was on your GitHub page and was unable to find the compiled product anywhere (nor on this forum that I could see). I am wondering if you can provide a download for this, or instructions on how to convert the C++/cmake stuff into an executable (might be more fun to do it myself since I want to get into cmake stuff myself).

Thanks for any help in advance.
